

EL Readonly User Access

Stock Access Error — Fix Report

Module: el_readonly_user Version: 18.0.1.2.0

Author: Ibrahim Elmasry

1. Issue

Readonly users were failing on stock.picking because Odoo stock forms/workflows can perform ACL-level write checks. The readonly group had only read ACLs, causing the access error before the readonly write-blocking layer could protect the operation.

2. Required Behavior

Readonly users can view warehouses and all permitted stock movements, but cannot create, edit, delete, validate, cancel, scrap, or otherwise execute stock-changing operations.

3. Fix

ACL-level write capability is now available for stock.picking, stock.move, stock.move.line, stock.quant, stock.scrap, and stock.valuation.layer. Create and delete remain disabled. The existing readonly ir.rule enforcement still blocks actual write/create/unlink operations.

4. Configuration

Configuration and Settings menus remain hidden for readonly users. Inventory and stock movement menus remain visible.

5. Validation

Python AST parsing: PASS. ZIP integrity: PASS. Static security-flow review: PASS. Live Odoo runtime/database validation: NOT PERFORMED.

6. Staging Test

Verify Inventory, warehouses, receipts, deliveries, internal transfers and stock picking forms open without the previous error; verify edit/save and stock workflow actions are blocked; verify Configuration remains hidden; verify normal users are unaffected.

7. Security Note

The stock ACL write permission is a compatibility mechanism for permission checks. It must not be interpreted as business write access because the readonly record-rule layer blocks the actual modification operation. Test this behavior on staging with the exact installed Odoo version and modules.

Operation	Result
Read / View	Allowed
Create	Denied
Write / Edit	Denied by readonly rule
Delete	Denied
Stock workflow writes	Denied by readonly rule
