

EL Readonly User Access

Post-Change Implementation Report

Version 18.0.1.2.0

1. Executive Summary

Readonly users can view inventory, warehouses, and stock movements while remaining unable to create, edit, delete, or execute stock operations. Configuration and Settings menus remain hidden.

2. Security Matrix

Area	Readonly User
Inventory / Warehouse	View
Stock Movements	View
Create / Edit / Delete	Denied
Execute Stock Operations	Denied
Configuration / Settings	Hidden
Readonly Group in Access Rights	Visible

3. Changes Applied

- Restored read access to stock.picking, stock.move, stock.move.line, stock.scrap, stock.quant, and stock.valuation.layer.
- Removed stock-specific menu hiding.
- Kept server-side readonly protection for create, write, and unlink.
- Kept Configuration/Settings menu hiding.
- Kept the Readonly Access group available on Users → Access Rights.
- Updated module identity and author/company/maintainer to Ibrahim Elmasry.

4. Files Modified

- __manifest__.py
- hooks.py
- models/ir_model_access.py
- models/ir_ui_menu.py
- security/el_readonly_user_groups.xml
- README.rst
- doc/RELEASE_NOTES.md
- static/description/index.html

5. Security Notes

The module does not modify Odoo core. The JavaScript layer disables normal form create/edit controls, but server-side ACL/ORM checks remain the security boundary. Stock buttons may still be visible depending on installed views; modification actions must be rejected by server-side security.

6. Validation

- Python source compilation: PASS.

- XML parsing: PASS.
- Manifest and module structure inspection: PASS.
- ZIP integrity: PASS.
- Live Odoo runtime/database validation: NOT PERFORMED in the packaging environment.

7. Staging Test Plan

- Open Inventory, Warehouses, Locations, Receipts, Delivery Orders, Transfers, Internal Transfers, Stock Moves, and Move Lines.
- Attempt create/edit/delete on stock records; all must be denied.
- Attempt validate/cancel/scrap or other stock operations; all must be denied.
- Confirm Configuration/Settings menus are hidden.
- Confirm normal non-readonly users are unaffected.

8. Deployment Note

If the previous installed technical module name differs, handle the change as a module migration/rename and verify XML IDs and installed-module state before production deployment.
